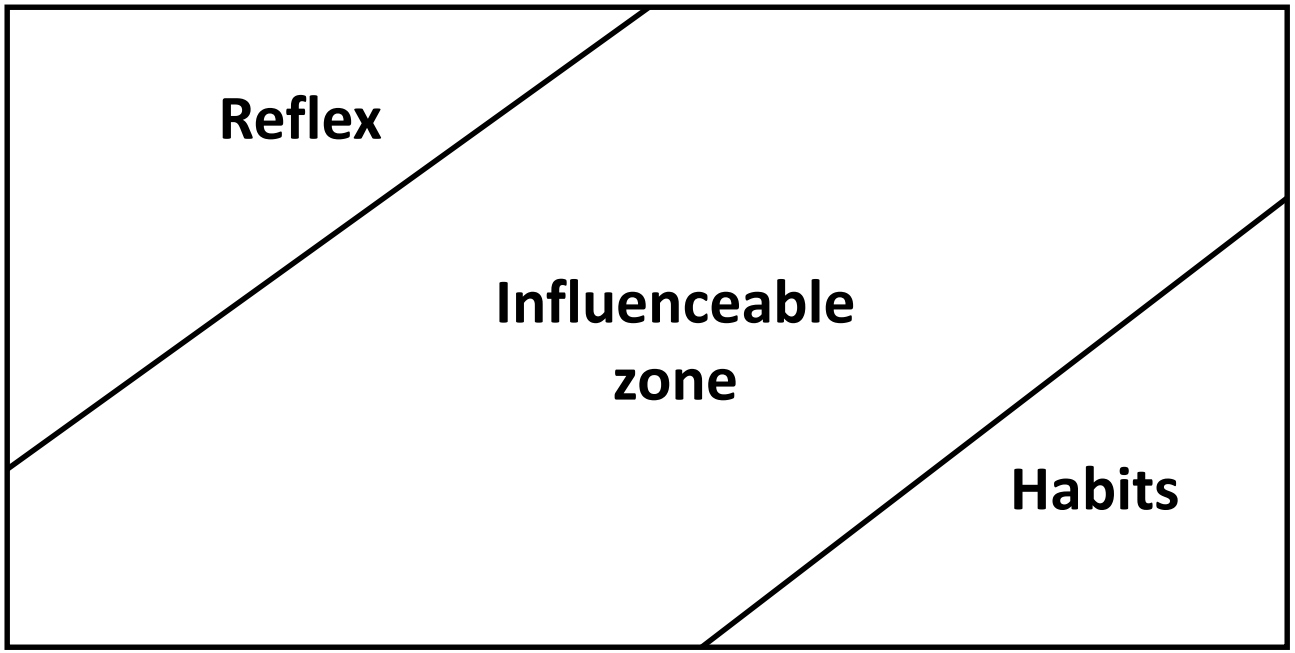
What is Motivation?

- **Motivation**
  - Motivation is a human psychological characteristic that contributes to a person's degree of commitment.
  - Factors that cause, guide and sustain human behavior in a particular committed direction. Conscious and sub-conscious behavior.
- **Motivation in management**
  - Motivation is a management process of influencing other people's behavior.

What is Motivation?

- Motivation deals with the range of conscious human behavior somewhere between two extremes - reflex actions and Habits.



Common assumptions about Motivation

- Motivation is commonly assumed to be a good thing.
- Motivation is in short supply and it need of periodic replenishment
- Motivation is one of several factors that goes into a person's performance
- Motivation is a tool with which managers can design job relations in an organization

Early views of motivation

- **The Traditional model**
  - It is associated with Fredrich Taylor. Here manager determine the most efficient way to perform a task and then motivate the worker with a system of wage incentives.
  - The underlying assumption is that, managers understand the work better than the worker who are actually lazy and can be motivated only by money.

Early views of motivation

- **The Human Relations Model**
  - They found that the boredom and repetition of a task actually reduce motivation. While social contacts help to create and sustain motivation.
  - The underlying assumption is that, managers can motivate workers by acknowledging their social needs and by making them feel important and useful.

Early views of motivation

- **Human Resource Model**
  - Associated with Doglas McGregor.
  - The underlying assumption is that, in modern industrial life, to take advantage of the employee's inherent willingness and ability to work, managers should provide a climate that gives employee scope for personal improvement.

Maslow's need theory on motivation

- Maslow's Hierarchy of Needs Theory is regarded as one of the most popular theories on motivation. It is a theory of psychology that explains that humans are highly motivated in order to fulfill their needs, which is based on hierarchical order.
- It was first introduced by Abraham Maslow in 1943 for his paper titled Theory of Motivation and is based on a hierarchy of needs, which starts with the most basic needs and subsequently moves on to higher levels.
- The main goal of this need hierarchy theory is to attain the highest position or the last of the needs, i.e need for self actualization.

Maslow's need theory on motivation

- The levels of hierarchy in Maslow's need hierarchy theory appear in the shape of a pyramid, where the most basic need is placed at the bottom while the most advanced level of hierarchy is at the top of the pyramid.

- Maslow was of the view that a person can only move to the subsequent level only after fulfilling the needs of the current level. The needs at the bottom of the pyramid are those which are very basic and the most complex needs are placed on the top of the pyramid.

Self-actualization
desire to become the most that one can be
Esteem
respect, self-esteem, status, recognition, strength, freedom
Love and belonging
friendship, intimacy, family, sense of connection
Safety needs
personal security, employment, resources, health, property
Physiological needs
air, water, food, shelter, sleep, clothing, reproduction

Maslow's need theory on motivation

Maslow's need theory

- **1. Physiological needs:** The physiological needs are regarded as the most basic of the needs that humans have. These are **needs that are very crucial for our survival.** The examples of physiological needs are **air, water, food, shelter, health and sleep**, etc.
- **2. Safety Needs:** It is the needs **to keep ourselves safe and secure.** It deals with **personal security, employment, resources, health, property and so many**. Safety is needed to keep people safe inwardly and it makes them confident. It is that people would know what is right and wrong for them.
- The various actions taken by an individual in ensuring safety and security are finding a job, getting an insurance policy, choosing a secure neighborhood, etc.

Maslow's need theory

- **3. Social Needs:** This is the third level in the need hierarchy theory. It is that people should feel that **they are accepted and believed by the people of their society and that they have to belong with each other.** This deals with **love, friendship, hate, family, sense of connection and so many**.
- **4. Esteem needs:** This is considered as the fourth level of the hierarchy of needs theory. It deals with **getting recognition, self respect, status, strength, freedom** and so many. It deals with the fact that if you are going to give respect to others ultimately you are going to have it back, this leads to your self-satisfaction.

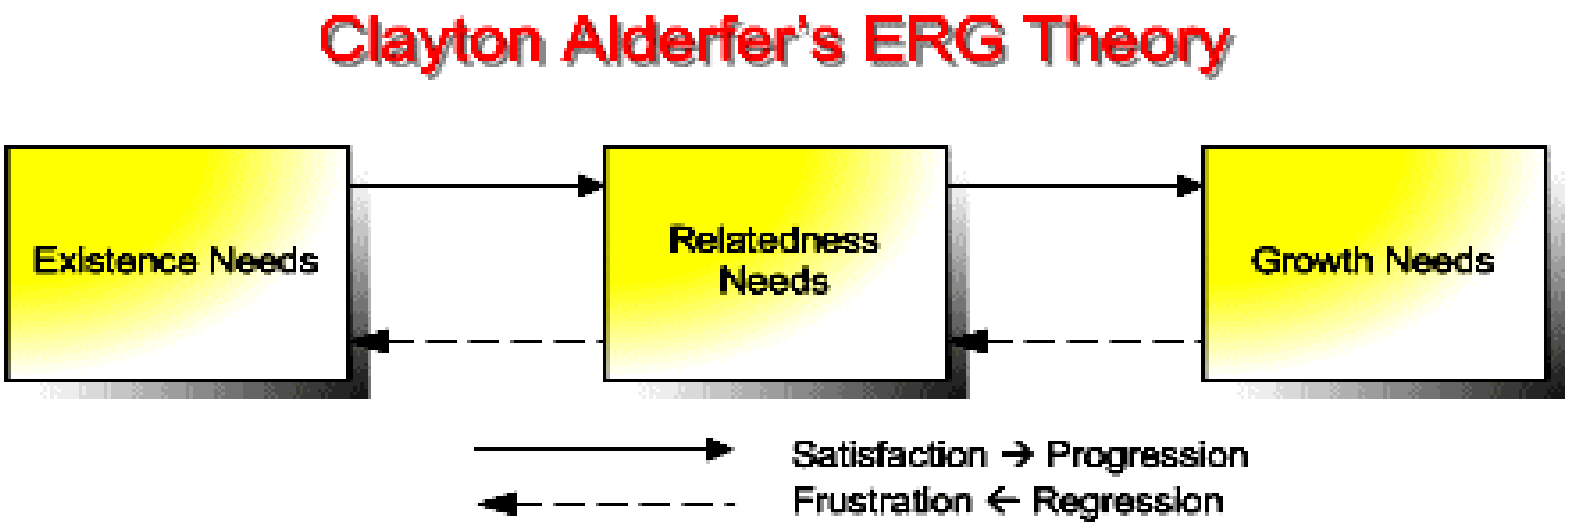
Maslow's need theory

- **5. Self-actualization needs:** This is the final level of the theory of hierarchy of needs as proposed by Maslow. It relates to the **need of an individual to attain or realize the full potential of their ability or potential.** Self-Actualization needs - **realizing personal potential, self-fulfillment, seeking personal growth and peak experiences.**

- Individual will be motivated to fulfill whichever need is most powerful for them in that time. When all other needs are adequately met employees will be motivated by self actualization need.

Alderfer's ERG theory of Motivation

- The letters ERG stand for three levels of needs: Existence, Relatedness, and Growth. The ERG theory is based on the work of Maslow, so it has much in common with it but also differs in some important aspects.



- This model says that all humans are motivated by these three needs. The most concrete and motivating need is **existence**, which really relates to physical and psychological survival. The next level is the need for **relatedness**, a sense of community and a good relationship with yourself. The least concrete, but still important in the ERG model is **growth**, which really relates to self-development, fulfillment and the sense of achieving your potential.
- **This Theory states that individuals can be motivated by multiple levels of need at the same time**, and that the level which is most important to them can change over time. In other words, an individual's priorities and motivations may be fluid and can move between the existence, relatedness and growth levels of need over time. They can move upwards, and they can move downwards.

ERG theory

Similarities to Maslow's Hierarchy

- The ERG needs can be mapped to those of Maslow's theory as follows:
  - Existence: Physiological and safety needs
  - Relatedness: Social and external esteem needs
  - Growth: Self-actualization and internal esteem needs
- Like Maslow's model, the ERG theory is hierarchical - existence needs have priority over relatedness needs, which have priority over growth

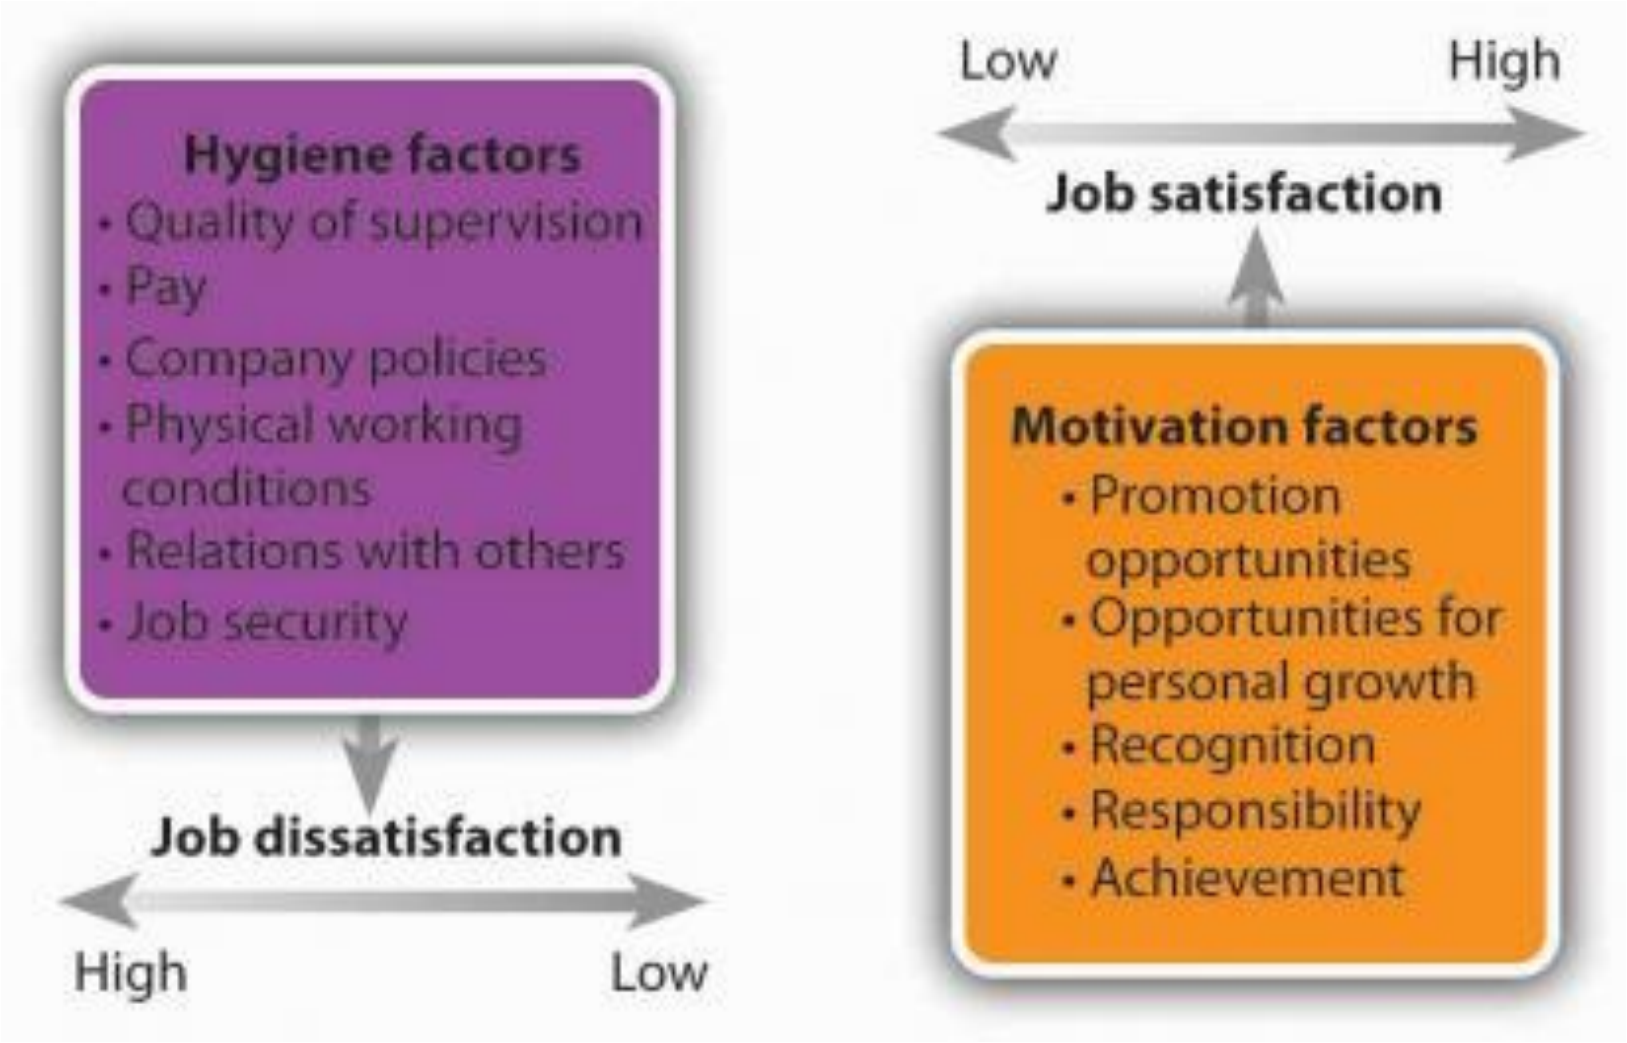
Differences from Maslow's Hierarchy

- Unlike Maslow's hierarchy, the ERG theory allows for different levels of needs to be pursued simultaneously.
- The ERG theory allows the order of the needs be different for different people.
- The ERG theory acknowledges that if a higher level need remains unfulfilled, the person may regress to lower level needs that appear easier to satisfy.

The two factor theory

- Fredrick Herzberg and his associates conducted a study if the job attitude of 200 engineers and accountants. He concluded that, job dissatisfaction and satisfaction arises from two distinct set of factors.
  - The HYGIENE factors do little contribution to provide job satisfaction. He called them "DISSATISFIERS' as their absence cause dissatisfaction but their presence is not motivating but only prevent dissatisfaction.
  - MOTIVATING factors act as forces of job satisfaction. They create positive and a permanent effect on employee's performance and are related to work itself.

The two factor theory

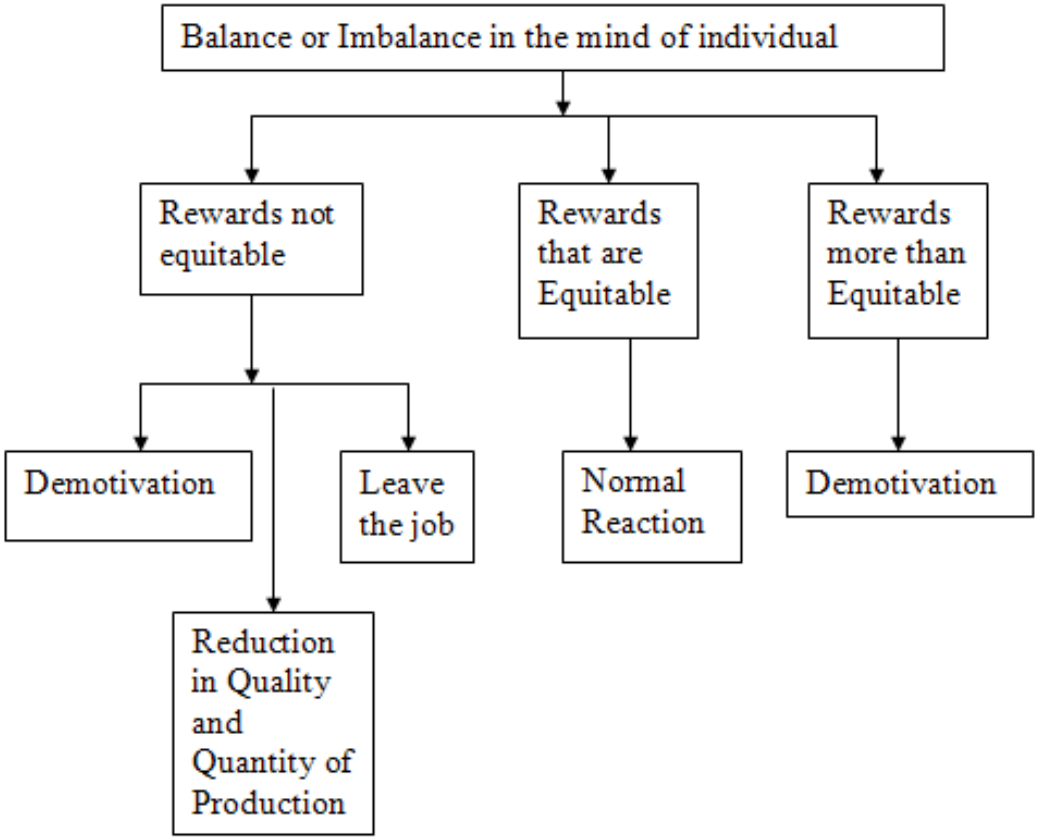


Equity Theory

- People develop beliefs about what is a fair reward for one' job contribution - an exchange
- People compare their exchanges with their employer to exchanges with others-insiders and outsiders called **referents**
- If an employee believes his treatment is equitable, compared to others, he or she will be motivated to do something about it -- that is, seek justice.

Equity Theory

$$\frac{\text{Out comes by a person}}{\text{Inputs by a person}} = \frac{\text{Out comes by another person}}{\text{Input by another person}}$$



Expectancy theory of motivation

- The **Vroom's expectancy theory** of motivation has become a commonly accepted theory for explaining how individuals make decisions regarding various behavioral alternatives. Expectancy theory offers the following propositions:
  - When deciding among behavioral options, individuals select the option with the greatest motivation forces (MF).
  - The motivational force for a behavior, action, or task is a function of three distinct perceptions: Expectancy, Instrumentality, and Valance. Vroom concludes that the force of motivation in an employee can be calculated using the formula:
  - **Motivation = Valence+Expectancy+Instrumentality**

Expectancy theory of motivation

- **Effort performance Expectancy (Expectancy probability):** *Expectancy can be described as the belief that higher or increased effort will yield better performance*. This can be explained by the thinking of "If I work harder, I will make something better". Conditions that enhance expectancy include having the correct resources available, having the required skill set for the job at hand, and having the necessary support to get the job done correctly.
- **Performance Outcome Expectancy (Instrumentality probability):** *Instrumentality can be described as the thought that if an individual performs well, then a valued outcome will come to that individual*. Some things that help instrumentality are having a clear understanding of the relationship between performance and the outcomes, having trust and respect for people who make the decisions on who gets what reward, and seeing transparency in the process of who gets what reward.
- **Valence:** *Valence means "value", that means, how much a person values a reward*. Specific outcome has a specific valence that is the power to motivate which varies from individual to individual. For instance, a bonus may not increase motivation for an employee who is motivated by formal recognition or by increased status such as promotion.

Application of Expectancy Theory

- Determine the reward valued by each employee
- Determine the performance you desire
- Make the performance level attainable
- Link reward to performance
- Analyze what factors might counteract the effectiveness of the reward
- Make sure the reward is adequate
